№ 47 от 24. 05. 2001г

Dear Sir,

We have developed the methods of longtime, middle-time and short-time prevision of catastrophic natural events as earthquakes, hurricane, tornado, cyclones, floods. We also have developed unique methods and possibilities to reduce the damage of these events and even to avoid these events in concrete regions. Announcements about our works have been made widely in the Russian, Greek, Turkish, Italian press, Radio and TV.

During our visit of Italy in September of 2000 we tried to organize cooperation with Italian scientists, specialists and representatives of the Catholic church. We were assured by Italian specialists in their wish to cooperate with us. There were the time and possibility to develop cooperation between us during the period of the time from September of 2000 to February of 2001 to avoid the future seismic catastrophe in the North-western part of Italy and South-eastern part of France and to save the life of the people. We did our best for these in the endless waiting of promised cooperation from Italian side.

But because of unknown for us reasons this cooperation had no place. And in the March of this year we have started to work for other projects.

But our last observations shows us that the catastrophic events seismic as well as synoptic will take place in a very short time in the region with coordinates: 44-45 grad. North latitude and 7-9,5 grad. East longitude. From our point of view this information is very important because of the following meeting of the heads of states in Italy (Genoa) in the next July.

We are ready to give short-time prevision and to help to reduce expecting damage.

Our coordinates: 300008, Tula, [REDACTED], [REDACTED], tel. 8-087-2 [REDACTED];

Best regards,

Director, professor Oleg Martynov
